
Drug-Drug Interaction Assessment for Therapeutic Proteins Guidance for Industry

DRAFT GUIDANCE

This guidance document is being distributed for comment purposes only.

Comments and suggestions regarding this draft document should be submitted within 90 days of publication in the *Federal Register* of the notice announcing the availability of the draft guidance. Submit electronic comments to <https://www.regulations.gov>. Submit written comments to the Division of Dockets Management (HFA-305), Food and Drug Administration, 5630 Fishers Lane, rm. 1061, Rockville, MD 20852. All comments should be identified with the docket number listed in the notice of availability that publishes in the *Federal Register*.

For questions regarding this draft document, contact (CDER) Office of Clinical Pharmacology Guidance and Policy Team at CDER_OCP_GPT@fda.hhs.gov, (CBER) Office of Communications at ocod@fda.hhs.gov, 800-835-4709, or 240-402-8010.

**Drug-Drug Interaction Assessment for Therapeutic Proteins
Guidance for Industry¹**

This draft guidance, when finalized, will represent the current thinking of the Food and Drug Administration (FDA or Agency) on this topic. It does not establish any rights for any person and is not binding on FDA or the public. You can use an alternative approach if it satisfies the requirements of the applicable statutes and regulations. To discuss an alternative approach, contact the FDA staff responsible for this guidance as listed on the title page.

I. INTRODUCTION

The purpose of this guidance is to help sponsors of investigational new drug applications (INDs) and applicants of biologic license applications (BLAs) determine the need for drug-drug interaction (DDI) studies for a therapeutic protein (TP) by providing a systematic, risk-based approach.^{2,3}

For the purpose of this guidance, a TP refers to a protein, licensed as a therapeutic biological product under section 351 of the Public Health Service Act (42 U.S.C. 262).^{4,5} Although this guidance applies to therapeutic proteins, the general concepts could be applicable to other biological products, including biological products regulated by CBER such as cellular and gene therapies.

This guidance supplements the final FDA guidances entitled *In Vitro Drug Interaction Studies—Cytochrome P450 Enzyme- and Transporter-Mediated Drug Interactions and Clinical Drug*

¹ This guidance has been prepared by the Therapeutic Protein DDI Working Group in the Office of Clinical Pharmacology in the Center for Drug Evaluation and Research in collaboration with the Center for Biologics Evaluation and Research at the Food and Drug Administration.

² Schrieber SJ, E Pfuma-Fletcher, X Wang, YC Wang, S Sagoo, R Madabushi, S Huang, and I Zineh, 2019, Considerations for Biologic Product Drug–Drug Interactions: A Regulatory Perspective, *Clin Pharmacol Ther*, 105:1332-1334.

³ Hereafter, sponsors will refer to either applicants or sponsors.

⁴ Section 351 of the Public Health Service Act, 42 U.S.C. § 282.

⁵ Please refer to the FDA web page, *Transfer of Therapeutic Biological Products to the Center for Drug Evaluation and Research*, for more information about these products available at: <https://www.fda.gov/combination-products/classification-and-jurisdictional-information/transfer-therapeutic-biological-products-center-drug-evaluation-and-research>.

Contains Nonbinding Recommendations

Draft—Not for Implementation

27 *Interaction Studies — Cytochrome P450 Enzyme- and Transporter-Mediated Drug Interactions*
28 (January 2020).⁶

29
30 In general, FDA's guidance documents do not establish legally enforceable responsibilities.
31 Instead, guidances describe the Agency's current thinking on a topic and should be viewed only
32 as recommendations, unless specific regulatory or statutory requirements are cited. The use of
33 the word *should* in Agency guidances means that something is suggested or recommended, but
34 not required.

35

36

II. CONSIDERATIONS FOR ASSESSING DDIs FOR TPs

37
38
39 When evaluating the potential for a DDI between a TP and small molecules or between TPs,
40 sponsors should consider the mechanisms of a potential DDI, taking into account the
41 pharmacology and clearance of the TP as well as any co-administered medications in the patient
42 population.⁷

43
44 Below, we provide examples of the types of situations in which an assessment of the DDI
45 potential of a TP can be warranted. This list should not be considered all-inclusive, as the
46 development of novel TPs will continue to inform the DDI risk. Also, refer to the decision tree in
47 the Appendix for more information.

48

A. Proinflammatory Cytokine-Related Mechanisms

49
50
51 TPs that are proinflammatory cytokines (e.g., peginterferon) or TPs that cause increases in
52 proinflammatory cytokine levels can down-regulate the expression of cytochrome P450 (CYP)
53 enzymes, thereby decreasing the metabolism of drugs that are CYP substrates and increasing
54 their exposure levels.⁸ Conversely, TPs that reduce cytokine levels (e.g., TNF inhibitors) can
55 relieve the CYP down-regulation from an inflammatory environment (e.g., rheumatoid arthritis),
56 thereby increasing CYP expression and activity and reducing exposure for CYP substrates. Of
57 note, therapies such as T-cell redirecting bispecific antibodies as well as certain cellular and gene
58 therapies can cause cytokine release syndrome. Co-medication in some cases could be used to
59 treat or prevent these increases in cytokines. These changes in cytokines have the potential to
60 affect CYP expression as well as the activity and exposure for CYP substrates.

61

1. The TP is a Proinflammatory Cytokine

62

⁶ For the most recent version of a guidance, check the FDA guidance web page at <https://www.fda.gov/RegulatoryInformation/Guidances/default.htm>.

Contains Nonbinding Recommendations

Draft—Not for Implementation

64 The sponsor should evaluate the DDI potential for TPs that are proinflammatory cytokines.

65

66 **2. The TP is a Cytokine Modulator**

67

68 a. The TP causes an increase in proinflammatory cytokine levels

69

70 The increase in cytokine levels as a result of TP treatment can be transient or persistent.
71 Therefore, the sponsor should determine the time course and extent of this increase in cytokine
72 levels to help determine the need for a DDI study, the design of a study, and an appropriate
73 mitigation strategy, if necessary. If the sponsor determines that the DDI potential of the TP is
74 low, they should contact the FDA and provide justification for this determination (see
75 Appendix).

76

77 b. The TP modulates proinflammatory cytokines in conditions associated
78 with elevated cytokine levels

79

80 Levels of proinflammatory cytokines differ by disease type and severity of disease, leading to
81 variability in CYP expression. These considerations make it challenging to design a DDI study
82 that can be extrapolated beyond the study population. Hence, the labeling for such
83 proinflammatory cytokine modulators should include language indicating the potential for a
84 DDI.

85

86 A sponsor can provide justification why they would prefer to not include the labeling language if
87 they believe that the potential for clinically significant DDI is low.⁹ Justification can include a
88 discussion of:

89

- 90 • Effects seen with other agents or the same agent in other disease states with similar or
91 more inflammatory burden
- 92 • Differences in exposure levels of sensitive CYP substrates in healthy subjects versus the
93 indicated population
- 94 • The magnitude of the drug effect or the extent of cytokine modulation by the TP

95

96 Alternatively, the sponsor can perform a DDI study in the relevant indicated population to
97 further inform labeling. The disease type and severity and dose(s) used are important
98 considerations. Therefore, if a TP is being developed for multiple indications, the potential for
99 DDIs can be evaluated in the disease with the most severe inflammatory burden.

100

101 **B. Mechanisms of DDIs Unrelated to Proinflammatory Cytokines**

102

103 Mechanisms unrelated to proinflammatory cytokines have been observed or postulated where the
104 TP acts as a perpetrator (e.g., an inhibitor or inducer) or a victim of a small molecule or other TP

⁹ Coutant DE and SD Hall SD, 2018, Disease-Drug Interactions in Inflammatory States Via Effects on CYP-Mediated Drug Clearance, J Clin Pharmacol, 58(7):849-863.

Contains Nonbinding Recommendations

Draft—Not for Implementation

107 DDI. Depending on the expected mechanism of the DDI, a TP could be evaluated as a victim or
108 as a perpetrator. Scenarios when DDI evaluation should be considered include:

- 109
- 110 • When a TP affects human physiological processes that can in turn alter the
111 pharmacokinetic profiles of co-administered medications (e.g., GLP-1 receptor agonists
112 such as dulaglutide and albiglutide result in delayed gastric emptying). In this case, the
113 sponsor should evaluate the TP as a perpetrator.
 - 114
 - 115 • Co-administered medications that impact the TP target or target-mediated disposition.^{10,11}
116 In these cases, depending on the role of the TP in the DDI, the sponsor should evaluate
117 the DDI potential of the TP either as a perpetrator or as a victim.
 - 118
 - 119 • Co-administered medications that compromise the function of the FcRn can affect TPs
120 which interact with the FcRn (e.g., blocking or interfering with the interaction between
121 TPs containing an Fc region of human IgG and FcRn).¹² In these cases, the sponsor
122 should evaluate the DDI potential of the TP as a victim.
 - 123
 - 124 • Co-administration of immunosuppressors with a TP whose pharmacokinetics are affected
125 by immunogenicity (e.g., methotrexate on the clearance of adalimumab).⁵ Since
126 immunogenicity (i.e., the formation of antibodies to TPs) can alter the clearance of some
127 TPs, drugs that suppress immunogenicity can change the clearance of a TP. In these
128 cases, the sponsor should evaluate the DDI potential of the TP as a victim. This type of
129 DDI evaluation can be difficult to prospectively design, in which case a descriptive
130 analysis can often be considered adequate.

C. Antibody-Drug Conjugates

131

132 For antibody-drug conjugates (ADCs), the small molecule drug component conjugated to the
133 antibody component can be released into unconjugated form. Therefore, the DDI potential of
134 both the antibody and the small molecule drug components should be evaluated as described
135 below:

- 136
- 137 • For the antibody component, consider the categories described above (see Section II) to
138 determine if a DDI assessment is warranted.
 - 139 • For the small molecule drug component, follow the considerations described in the final
140 FDA guidances for industry entitled *In Vitro Drug Interaction Studies—Cytochrome*

Draft—Not for Implementation

144 *P450 Enzyme- and Transporter-Mediated Drug Interactions and Clinical Drug*
145 *Interaction Studies — Cytochrome P450 Enzyme- and Transporter-Mediated Drug*
146 *Interactions* (January 2020).

147
148 It is important to understand the systemic exposure of the small molecule drug component of the
149 ADC. In many cases, the systemic concentration might be too low to act as a perpetrator. It
150 might be necessary to evaluate the small molecule component (administered as an ADC) as a
151 victim drug. Understanding the exposure-response relationship of the various moieties is
152 important in determining the need for and significance of DDI studies. For example, if systemic
153 concentrations of the free small molecule drug are low, evaluating the effect of strong CYP3A
154 inducers on the drug's pharmacokinetics might not be necessary if the free small molecule drug
155 in circulation is not contributing to efficacy. However, a study with a strong inhibitor could be
156 necessary due to the potential for safety concerns associated with the increase in concentration of
157 the free small molecule drug in the circulation. Although there are limitations in the ability to
158 modify the dose of an ADC, the sponsor should seek to understand whether a drug can be safely
159 used concomitantly with the ADC.

160

161

162 **III. TYPES OF DDI ASSESSMENTS AND STUDY DESIGN CONSIDERATIONS**

163

164 Using a systematic, science-driven approach to evaluate the DDI potential of TPs is highly
165 recommended and can involve a combination of the assessment types listed below. Sponsors
166 should consider the DDI risk of their product early in development and summarize their DDI
167 program at milestone meetings with the FDA. Potential discussion topics at these meetings
168 include the need for and planning, timing, and study design of DDI evaluations for the
169 investigational drug.

170

171 **A. In Vitro and Animal Studies**

172

173 The translation of in vitro data or animal data to humans has been limited. However, some
174 methods could provide mechanistic understanding of the DDI potential of a TP and in some
175 cases be combined with physiologically based pharmacokinetic (PBPK) models.
176 Recommendations on the use of in vitro and animal studies may be further updated once relevant
177 models are validated for their intended use. In vitro DDI evaluation for the small molecule drug
178 component of an ADC should be performed consistent with the final FDA guidance for industry
179 entitled *In Vitro Drug Interaction Studies — Cytochrome P450 Enzyme- and Transporter-*
180 *Mediated Drug Interactions* (January 2020) (see Section IIC).

181

182 **B. Clinical Studies**

183

184 Clinical studies of TPs should consider the suspected mechanism for the DDI when selecting the
185 relevant study population and the interacting drugs to evaluate. The study design (parallel or
186 crossover) should be informed by the suspected mechanism of the DDI and the pharmacokinetic
187 (PK) characteristics of the drugs (e.g., the drug's half-life).

188

Contains Nonbinding Recommendations

Draft—Not for Implementation

189 For TPs with a long half-life, a parallel design might be appropriate in evaluating the TP as a
190 victim. A single sequence crossover design (substrate followed by the substrate plus the TP) can
191 be used when evaluating the TP as a perpetrator (e.g., the effect of proinflammatory cytokines or
192 cytokine modulators on CYP substrates). The sponsor should determine the time course for
193 cytokine modulation by the TP in the specific disease state to guide the timing and duration of
194 administration of substrate and TP in the study. A cocktail approach is an efficient means of
195 evaluating the DDI for TPs where multiple CYPs could be impacted (e.g., proinflammatory
196 cytokines and cytokine modulators).

197

198 **C. Population PK Modeling (Nested DDI Studies)**

200 Population PK analyses can be informative in the evaluation of DDIs for TPs.^{13,14} A population
201 PK analysis for prospective DDI evaluation should have carefully designed study procedures and
202 protocols for the collection of PK samples. In general, this approach can be used to evaluate the
203 effect of other agents on the investigational TP as PK data are usually only collected for the
204 investigational agent. However, a sponsor can prospectively plan and collect the necessary data
205 for a substrate of interest to support the evaluation of the investigational TP as a perpetrator. For
206 a discussion on nested DDI studies, refer to the final FDA guidance entitled *Clinical Drug*
207 *Interaction Studies — Cytochrome P450 Enzyme- and Transporter-Mediated Drug Interactions*
208 (January 2020) and the draft FDA guidance entitled *Population Pharmacokinetics* (July 2019).¹⁵

209

210 **D. Physiologically Based PK Modeling**

212 The application of PBPK modeling in the evaluation of the DDI potential of a TP is an emerging
213 area. PBPK modeling has a potential role in understanding the underlying mechanism of a DDI.
214 Sponsors are encouraged to contact the FDA when proposing to use PBPK modeling to evaluate
215 the DDI potential of TPs. For more information, see the FDA final guidance entitled
216 *Physiologically Based Pharmacokinetic Analyses — Format and Content* (September 2018).

217

218 **IV. LABELING RECOMMENDATIONS**

221 Prescribing Information must include a summary of essential DDI information needed for the
222 safe and effective use of the drug by the health care provider.¹⁶ For specific requirements and
223 recommendations regarding how to incorporate DDI information in labeling, refer to 21 CFR
224 201.57 and the following final FDA guidances:
